David Mingeaud

CS 290 Final Project Proposal

My final project will be a website for a pizza delivery restaurant. The four pages will tentatively be a main page, a menu page with an online order form, a contact page with a map, and an about page.

The main page will feature a rotating gallery of pizzas. This will most likely be where the unordered HTML list will be listing the types of pizzas available.

The menu page will feature a downloadable menu, with an online order form with a selection of pizza sizes using radio buttons and toppings using checkboxes. There will be an entry for to input an address on this page as well. The prices for the different sizes and extra toppings will be calculated and totaled before the customer clicks the submit button. Submitting this data will combine the ordered pizza and the address of the customer. This is where most of the JavaScript will function.

The contact page will contain an address and phone to a fictional building with a map to the building.

The about page will contain a fictional history of the restaurant contained in a scroll box.

The footer of the page will contain links to social media posts. I'm not going to open fictional social media accounts but the links will at least go to these website's main pages. These will be present on each page.
